

## Trade Counter Add Customers

The 'Trade Counter (TCM) Add Customer Plug-In' provides users of the Trade Counter module the option to add new customers to the Exchequer Enterprise Sales Ledger without leaving the TCM screen. The Plug-In includes a new button on the main screen of the Trade Counter, which once selected pops up a separate screen. The account code is validated against the existing Sales Ledger within Enterprise to ensure that any new customers created do not have the same account code as an existing customer record.

## Auto Settle Sales Ledger

The Auto-Settle Sales Ledger Plug-In will attempt to allocate all un-allocated transactions throughout the whole Sales Ledger.

## Postcode Lookup+

The Postcode Lookup+ utility provides users of Enterprise the ability to populate address fields directly from simply knowing the postcode. The Postcode Lookup+ utility is activated by Ctrl-5, and through a pop-up window enables the user to type in the postcode and review the proposed address. Once the address is confirmed, it is then 'pasted' back into Enterprise.

## Enterprise InfoBar

Enterprise InfoBar is an information bar that quickly shows key business information. It can be moved to any position on the screen and will always stay on top of every other program you load. It automatically loads when the computer is started and refreshes its data periodically based on a user setting between 1 and 60 seconds. The InfoBar can be set-up to show any type of transaction performing a count and sum functions. If the information is displayed too wide it will scroll continuously.

## Bank Specific BACS

Each of the BACS's Plug-In's will export batch payment or receipt runs in a banks specific format as appropriate.

## Auto Settle Sales Ledger

The Auto-Settle Sales Ledger Plug-In will attempt to allocate all un-allocated transactions throughout the whole Sales Ledger. From the Tools menu of Enterprise, the user will select an option titled 'Auto Settle Sales Ledger Accounts'. The Plug-in will then start allocating for each Sales Ledger account within the Trader List.

## Tax Settlement Discount

The Enterprise Tax Settlement Discount Plug-In overrides the normal operation by calculating VAT on the undiscounted net value of the transactions. Exchequer Software has developed this Plug-In for overseas customers only and do not certify its use in the UK. Exchequer Enterprise customers who apply this Plug-In to UK installations may risk invalidating their support terms and conditions with Exchequer Software Ltd.

## User Defined Periods

Enterprise enables you to have up to 99 periods in a financial year. However, if your periods are not strictly monthly, it can be difficult to determine exactly which period a transaction should be posted to. The user-definable accounting periods plug-in allows you to set-up a table of periods, each with start and end dates against each period. Upon entering a transaction, the system will post the transaction to the appropriate period in accordance with those defined and subject to the security within Enterprise stopping users from posting to previous periods, or prior to the last audit date.
